

## TEAM DETAILS :

**TEAM NAME :** DESIGN DYNASTY

**TEAM LEAD :** AMSA LAKSHMI K

**TEAM MEMBER :** NEHAA R

**PROBLEM HEADING :** TELEMEDICINE CONSULTATION BOOKING PLATFORM

**WEBSITE NAME :** HEALIX

## PROBLEM DESCRIPTION

Healthcare services in many hospitals and clinics still depend on manual processes, making it difficult for patients to access medical services quickly and efficiently. Patients often face long waiting times for appointments, limited access to doctors, and difficulty in maintaining their medical records. Doctors also find it challenging to manage patient information and appointment schedules using traditional methods. Existing healthcare websites mainly provide information but lack essential features such as secure user authentication, online appointment booking, patient and doctor dashboards, and centralized record management. These limitations reduce the efficiency and convenience of healthcare services. Therefore, a secure and user-friendly telemedicine platform is required to provide online consultation services, simplify appointment management, and improve communication between patients and doctors.

## METHODOLOGY USED TO SOLVE :

### Step 1: Requirement Analysis

- Identified problems in existing healthcare systems.
- Collected user requirements.
- Defined three user roles:
  - Patient
  - Doctor
  - Administrator

---

### Step 2: UI/UX Design

- Designed responsive user interfaces using Figma.

- Created pages for:
    - Home
    - About
    - Doctors
    - Appointment Booking
    - Login & Signup
    - Dashboards
- 

### Step 3: Frontend Development

Developed the user interface using:

- React.js
- TypeScript
- Tailwind CSS
- Responsive Design
- React Router

Features:

- User Registration
  - Login
  - Doctor Listing
  - Appointment Booking
  - Dashboards
  - Profile Management
- 

### Step 4: Backend Development

Implemented backend using Supabase.

Functions include:

- User Authentication
- Database Management
- CRUD Operations
- Secure Data Storage

- Role-based Access Control
- 

### Step 5: Database Design

Created relational database tables such as:

- Users
- Doctors
- Patients
- Appointments
- Medical Records
- Notifications

Relationships were established using foreign keys for efficient data management.

---

### Step 6: System Integration

Integrated frontend with backend APIs to enable:

- User authentication
  - Appointment booking
  - Profile updates
  - Doctor management
  - Real-time database operations
- 

### Step 7: Testing

Performed different testing methods:

- Functional Testing
- UI Testing
- Responsive Testing
- Manual testing

Verified:

- Login functionality
- Appointment booking
- Dashboard operations

- Database connectivity
- Error handling

## Step 8: Deployment

Deployed the application on Vercel and connected it with Supabase for cloud database and authentication services.

# FIGMA PAGES

# WORKFLOW :

# SUPABASE DATABASE FLOW :

The above figure represents the database schema of the Healix Telemedicine System developed using Supabase (PostgreSQL). It illustrates the tables, their attributes, and the relationships between them. The database includes tables such as Profiles, Doctors, Appointments, Medical Records, Prescriptions, and Notifications, which work together to manage user information, doctor details, appointment scheduling, medical records, prescriptions, and notifications. The relationships established through primary keys and foreign keys ensure secure data storage, maintain data integrity, and enable efficient communication between different modules of the system.
